

Benchtop and Floor Stand Drill Presses for Metal

These stationary drilling machines typically spin bits at low speeds with high torque. They maintain consistent alignment to create more accurate holes than handheld drills. Models with geared head drive eliminate belt slippage and the need to replace belts in belt drive drill presses.

Benchtop Drill Presses with Manual Downfeed—Mount to a work surface to save floor space and are more compact with a shorter spindle travel than floor-stand drill presses. They require hand-cranking to lower the bit so it can drill holes in metal workpieces.

Floor Stand Drill Presses with Manual Downfeed—Provide a long spindle travel to drill through thicker metal workpieces and create larger-diameter holes than benchtop drill presses. They require hand-cranking to lower the bit so it can drill holes in metal workpieces.

Floor Stand Drill Presses with Power Downfeed—The downfeed automatically lowers the drilling head at a smooth, consistent rate to drill holes. Models can drill more uniform holes than manual-downfeed presses.

Benchtop and Floor Stand Radial Drill Presses for Metal

Radial drill presses mount their drilling head on an arm that extends from the support column and allows vertical and horizontal positioning of the head. The drilling head moves up and down with the arm, and it can slide along the length of the arm to accommodate wide workpieces. They maintain consistent alignment to create more accurate holes than handheld drills. Models with a geared head drive eliminate belt slippage and the need to replace belts in belt drive drill presses.

Benchtop Radial Drill Presses with Manual Downfeed—Create holes in thinner workpieces and mount to work surfaces to save floor space. They are more compact with a shorter spindle travel than floor-stand drill presses, and their manual downfeed requires hand-cranking to lower the drill bit into workpieces.

Floor Stand Radial Drill Presses with Manual Downfeed—Have a long spindle travel to drill through thicker metal workpieces and create larger-diameter holes

than benchtop drill presses. Their manual downfeed requires hand-cranking to lower the drill bit into workpieces.

Floor Stand Radial Drill Presses with Power Downfeed—Provide a long spindle travel to drill through thicker metal workpieces and create larger-diameter holes than benchtop drill presses. Their power downfeed automatically lowers the drilling head at a smooth, consistent rate to drill more uniform and accurate holes than manual-downfeed presses.
