

LED Magnifier Lights

Their adjustable arm and pivoting head allow precise positioning for an optimal view. The lights' magnification states how many times larger its lens makes an object appear as compared to the actual size. Diopter refers to the curve of the lens. Larger numbers represent thicker, more curved lenses with greater magnification and a shorter focal length (working distance). As magnification and diopter increase, the focal length decreases and the closer the lens must be to the object to get a clear, crisp view.

Magnification	Diopter	Maximum Brightness	Arm Reach	Arm Design	Operating Voltage	Color	ESD Safe	Includes Ultraviolet Light	Color Temp.	Brand	Item No.
