LAB SUPPLIES Water Baths, Circulators & Chillers

Water Baths

Provide exact, stable temperature control. Ideal for heating and maintaining temperature-sensitive samples. Units include a corrosion-resistant, stainless steel reservoir and a digital display.

÷₩ ŵ PolyScience*

LW Scientific models offer an open reservoir, touchpad digital controller and red LED display.

PolyScience general purpose water baths feature a reservoir with a hinged gable cover and built-in drain, timer modes, and memory function

Heated and Refrigerated Circulators

Each unit includes a controller with easy-to-read LCD displays and menu prompts to guide users. Circulators limit excessive over-temperature protection by stirring. All circulators are made from powder painted steel.

Heated Circulators are ideal for warming reagents and culture media, thawing or tempering samples, biological incubation, cell culture, enzyme assays, or controlling the temperature of laboratory equipment such as chromatography columns, viscometers

and densitometers. Users can set their own temperature setpoints. The chemical resistant deck surface is cooler to the touch when operating at high temperatures.

Refrigerated Low-Profile Circulators offer quiet, energy efficient operation to regulate the amount of cooling needed. Low-profile models offer a space-saving design.

Heated and Refrigerated Circulators have large bath openings and chemical resistant decks on the units for easy cleaning.

Chillers

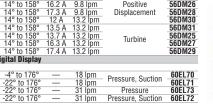

Benchtop Chillers-Provide consistent cooling for a variety of applications ranging from lasers and analytical equipment to reactors and manufacturing equipment. All units include displays and liquid level gauges or monitors

4.2 L ±0.1°

Durachill Portable Chillers—Direct steady cooling to remove heat for a variety of applications including laser etching, AA furnaces, ICP, rotary evaporators, vacuum systems, reaction vessels, plasma etching, and condenser cooling. They feature a self-cleaning filter system, front reservoir, and a liquid level monitor that prevents pump failure. The compact design takes up less floor space.

Recirculating Chillers-Have a powerful, speed-controlled pump to cool fluids. The pump has an indirect continuous adjustment of the maximum pressure and flow rate to keep temperatures stable. Chillers include insulated bath reservoirs that allow the use of thermofluid in the external cooling circle without refilling. They have a visible fluid level display and a drain valve for safe emptying along with an accessible air filter for cleaning.
